### The Configurations

AUDIANT

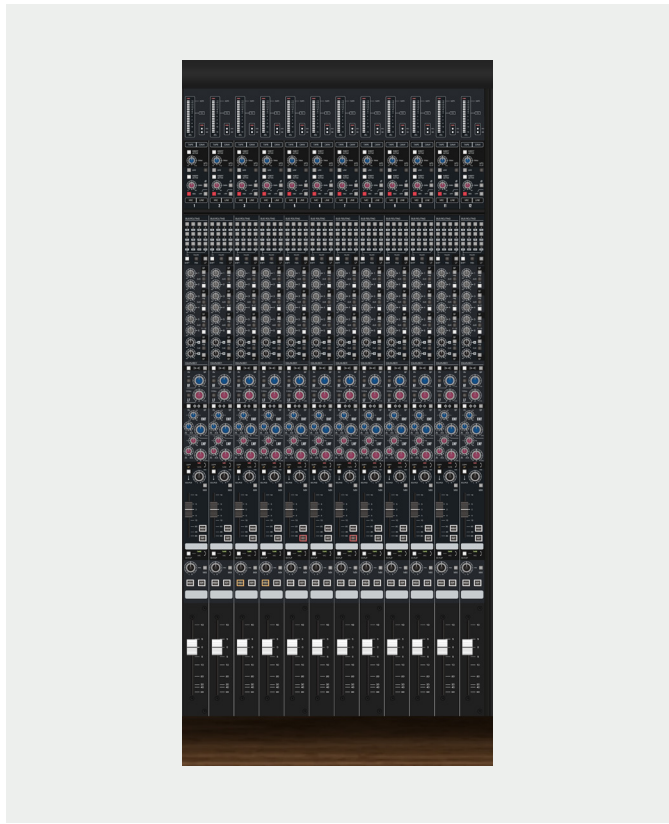

# The Modules

## How will you build yours?

Each ASP8024-Heritage Edition console is built to order and lovingly constructed in our Hampshire factory by a skilled team who've hand-assembled these consoles for over 20 years. The ASP8024-HE is a semi-modular console, offering you both standard configurations and all manner of bespoke layout possibilities to best suit your individual recording needs.

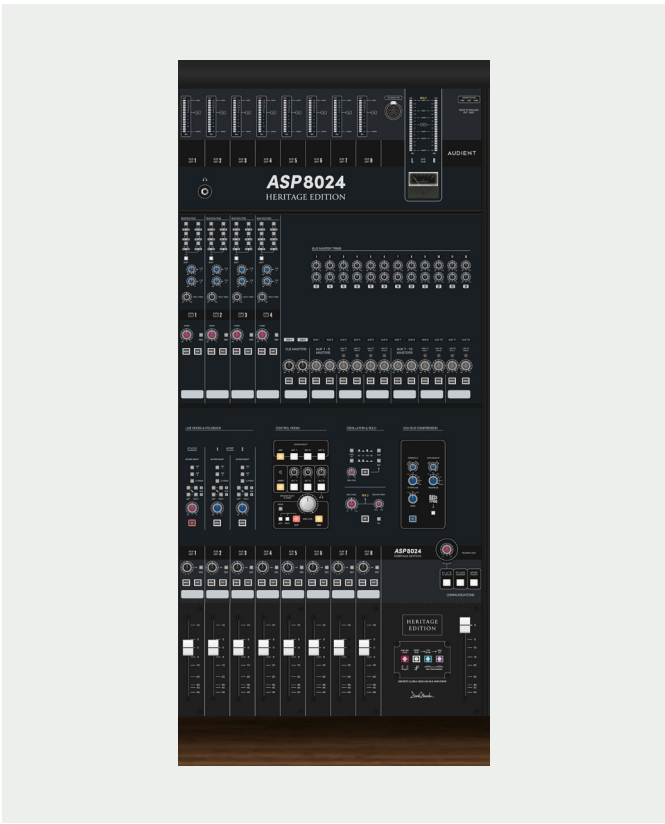

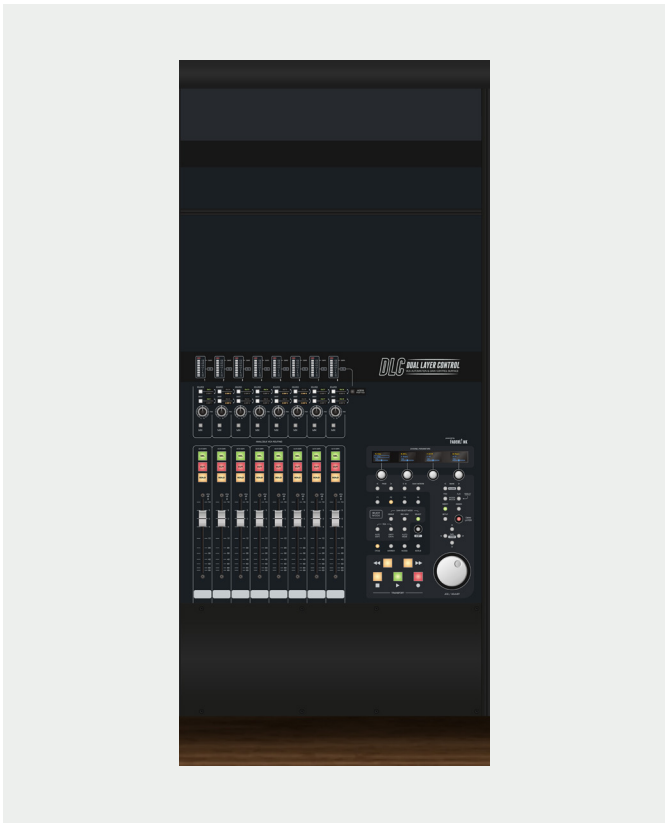

## Channel Module

The ASP8024-HE preamps use a transformerless, eight transistor design delivering low noise, low distortion, and high common mode rejection at all gain levels... offering a faithful reproduction of the source with just enough colour to give the signal some character.

## Master Module

The Master Module is the central control hub, allowing you to effortlessly glide around the console. Add mix bus processing, manage monitoring, create cue mixes, control sub-groups and stereo inputs, activate communications and more.

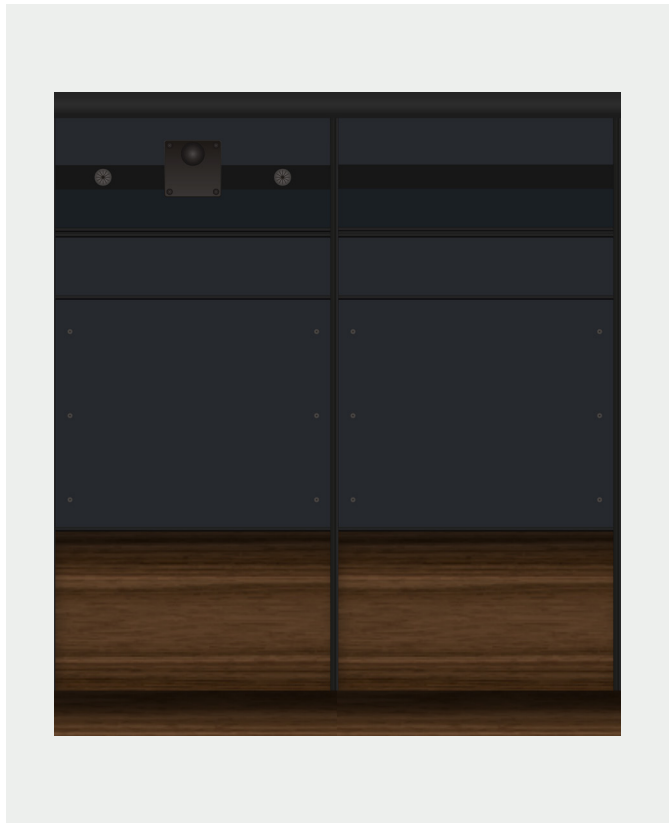

## Dual Layer Control

DLC provides creative DAW control and automation along with eight moving faders that can be banked across your entire session. DLC also enables you to have 8 channels of VCA automation for adding movement and finesse during your console mix balances and more. A range of useful control features are also available at your fingertips including transport control, track record enable and plug-in selection/editing, all of which enable you to navigate your session with ease.

## Patchbay

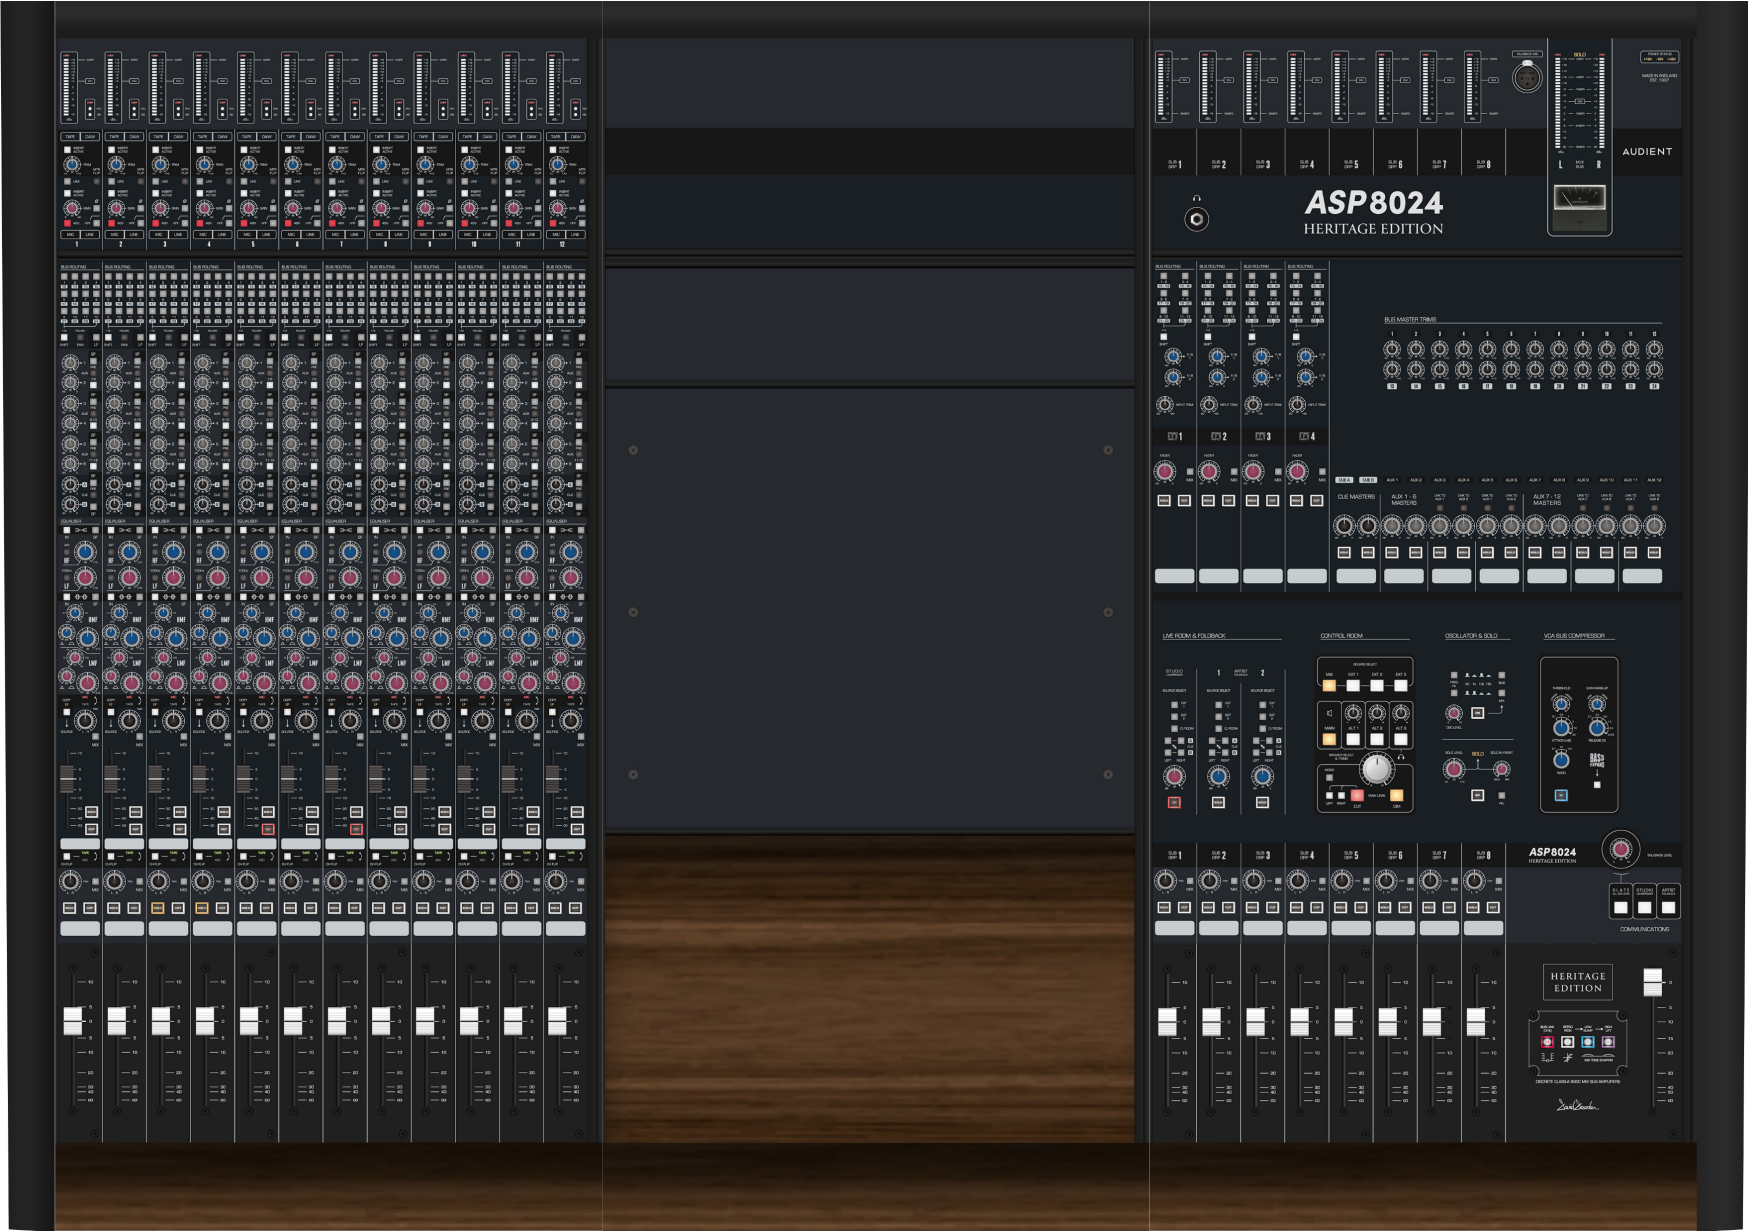

The heart of every great studio beats with flexible routing. Save time and money with the elegant single module, on-board patchbay for 24, 36 & 48CH consoles – constructed of high-quality Neutrik Bantam TT connectors. Our thoughtfully designed patchbay provides 144 user configurable points for integration of outboard, credenza racks or live room tie lines. These can be through-wired or half-normalled internally if required.

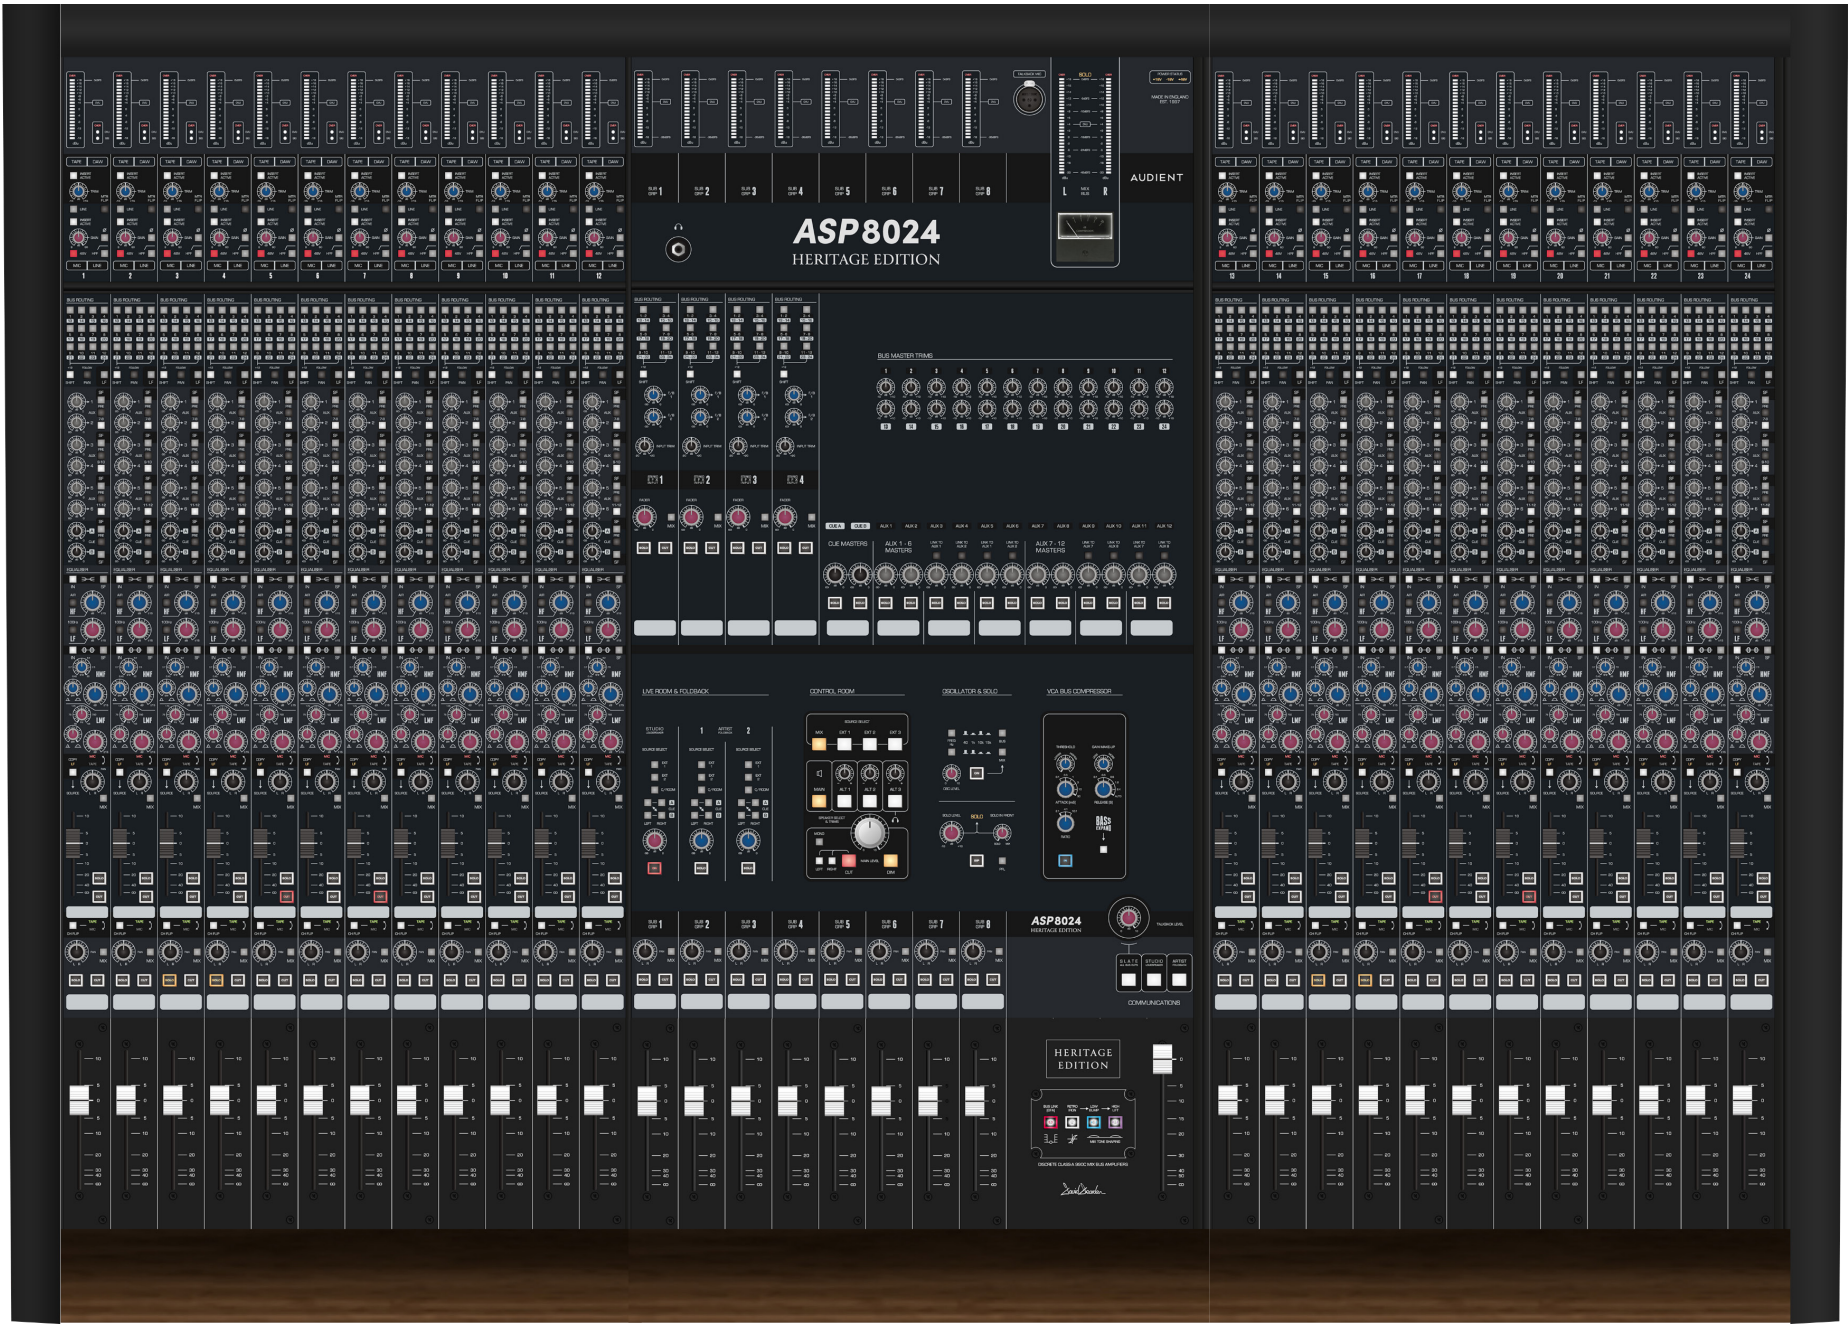

## Producer Desk

The Producers Desk provides you with extra real estate on your console, letting you place a computer, keyboard, mouse or even a control surface at the centre of your desk or off to one side for your assistant. This enables you to stay in the sweet spot when working ITB, thus speeding up your workflow and adding to your comfort.
